DETAILED ACTION

Specification

1. The lengthy specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.
2. The disclosure is objected to because of the following informalities:
3. Applicant is reminded of the proper language and format for an abstract of the disclosure.

The abstract should be in narrative form and generally limited to a single paragraph on a separate sheet within the range of 50 to 150 words. It is important that the abstract not exceed 150 words in length since the space provided for the abstract on the computer tape used by the printer is limited. The form and legal phraseology often used in patent claims, such as "means" and "said," should be avoided. The abstract should describe the disclosure sufficiently to assist readers in deciding whether there is a need for consulting the full patent text for details.

The language should be clear and concise and should not repeat information given in the title. It should avoid using phrases which can be implied, such as, "The disclosure concerns," "The disclosure defined by this invention," "The disclosure describes," etc.

Applicant uses "consisting of" in the abstract.
Appropriate correction is required.

Allowable Subject Matter

4. Claims 1-14 are allowed.
5. The following is a statement of reasons for the indication of allowable subject matter: The prior art does not teach or suggest (taken in combination with the other claimed features) an Nb-Al alloy powder for electrolytic capacitor comprising matrices containing AL or eutectic structures containing at least two selected from the group

Art Unit: 2831

consisting of NbAl_3 , Nb_2Al , Nb_3Al , and Nb, the particles being covered with dielectric layers when the powder is processed into an anode of an electrolytic capacitor (claims 1-11); and a method for manufacturing an Nb-Al alloy powder including particles that are covered with dielectric layers when the powder is processed into an anode of an electrolytic capacitor, the method comprising a step of quenching a molten Nb-Al alloy having an aluminum content of 27 to 90 % on a mass basis to form particles or thin sheets having dendritic microstructures with dendrite arm spacing of 3 μm and less (claims 12-14).

Conclusion

6. This application is in condition for allowance except for the following formal matters:

Applicant must amend the abstract to overcome the objections found on page 2 of the instant action.

Prosecution on the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

A shortened statutory period for reply to this action is set to expire **TWO MONTHS** from the mailing date of this letter.
